

Continuum Mobile UI QA Report

Run date: 2026-05-31 · Branch: `codex/mobile-live-session-detail`

Passed

Codex acted as orchestrator and QA reviewer. Agent Forge routing was used through an OpenCode/Qwen subagent for implementation guidance. Codex merged the final changes, ran verification, and performed simulator screenshot QA.

CHANGES VERIFIED

- Pairing screen changed from a scrollable layout to a single-screen compact layout.
- Manual pairing now uses the Flutter shadcn `InputOTP` component.
- Manual entry accepts a six-digit pairing code and resolves it against the configured pairing host instead of requiring `host:port:code`.
- Active session detail was restyled as a warm chat screen with a top bar, approval pill, larger message prose, tool cards, approval card, and bottom composer.
- Flutter shadcn registry validation, audit, and dependency checks pass with `input_otp` installed.

SIMULATOR EVIDENCE

iPhone 17 Pro simulator build succeeded through XcodeBuildMCP. Pairing screenshot:

COMMANDS

- flutter analyze passed.
- flutter test passed with 154 tests.
- flutter_shadcn validate --json passed.
- flutter_shadcn audit --json passed.
- flutter_shadcn deps --json passed.
- XcodeBuildMCP build_run_sim passed on iPhone 17 Pro, iOS 26.3.

KNOWN NOTE

External CLI subagents in this Codex session do not receive direct XcodeBuildMCP tool handles, so simulator execution was performed by Codex as QA verification after subagent guidance returned.
